SUBMITTED (DEC-1997) TO EMBL/GENBANK/DDBJ DATA BANKS.
SUBMITTED (CERNOTOCTIC FACTOR THAT ATTRACTE NONOCYTES, LYMPHOCYTES,
BASOPHILS AND EOSINOPHILS, BUT NOT NEUTROPHILS. SIGNALS THROUGH
CORRAB AND CCRS RECEPTORS. PLAYS A ROLE IN THE ACCUMULATION OF
LEUROCYTES AT BOTH SIDES OF ALLERGIT AND NONALLEGREET CINFLAMMATION.
MAI BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARPERIAL
WALL DURING THE DISEASE PROCESS OF ARTHEROSCIEROSIS. MAY PLAY A
ROLE IN THE MONOCYTE ATTRACTION IN TISSUES CHRONICALLY EXPOSED TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MASS SPECTROMETRY: MW-9314; MW_ERR=30; METHOD=MALDI; RANGE=17-98.
MASS SPECTROMETRY: MW-8760; MW_ERR=30; METHOD=MALDI; RANGE=22-98.
MASS SPECTROMETRY: MW-875; MW_ERR=30; METHOD=MALDI; RANGE=24-98.
INDUCTION: BY INTERLEUKIN-1 AND INP-ALPHA.
TISSUE SPECIFICITY: WIDEX: EXPRESSED. FOUND IN SMALL INTESTINE,
THYMUS, COLON, LUNG, TRACHEA, STOMACH AND LYMPH NODE. LOW LEVELS
SEEN IN THE PULMONARY ARTERY SMOOTH MUSCLE CELLS.
THIS PROTEIN CAN BIND HEPARIN.

Post-processing: Minimum Match 0% Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 24.749; Variance 37.567; scale 0.659

#title Two inflammatory mediator cytokine genes are closely linked and variably amplified on chromosome 17q.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ##cross_references EMBL:X52149; NID:g34750; PID:g296666

This protein is a member of a "small inducible" or "activation specific" gene family, is likely to be an early acting interleukin, and is the product of a putative G0/G1 switch gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            #authors Blum, S.; Forsdyke, R.E.; Forsdyke, D.R.

Isolation and characterization of a cDNA encoding a putative
cytokine which is induced by stimulation via the CD2
structure on human T lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                U.
J. Immunol. (1989) 142:1582-1590
Mitogenic activation of human T cells induces two closely
related genes which share structural similarities with a
new family of secreted factors.

                                                        ts annotation; conformation and disulfide bond assignments by (1)H-NMR, residues 24-92
This protein is secreted by activated lymphocytes and monocytes. It is bound by chemokine (C-C) receptor 5 (see PIR:A43113) and receptor 1 (see PIR:A45177).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         #journal Int. Mean 18.220; Variance 70.223; scale 0.259 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Protein with stem cell inhibition activity, e.g. LD78 or MIP-1 alpha unable to form stable multimer higher than dodecamer, providing better tissue penetration. Example 58; Page 71; 294p; English.

Example 58; Page 71; 294p; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-1 alpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution. Composities leading to enhanced productivity and greater therapeutic utility as stem cells. The analogues may be used in tumour therapy, psoriasis or other diseases involving hyperic to the profit in the cells.

Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg1>Cln (with canalogues correspond to the pref. LD78 analogues.

Example 13: Page 54: 294pp: English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-1 alpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution beyond certain stages (e.g. dodecamer), have improved solution to properties leading to enhanced productivity and greater therapeutic utility as stem cells.

In tumour therapy, psoriasis or other diseases involving hyperint therapy stem cells.

protein with stem cell inhibition activity, e.g. LD78 or MIP-1 alpha - unable to form stable multimer higher than dodecamer, alpha - unable to form stable multimer higher than dodecamer, browiding better tissue penetration as Emaple 6; Page 52; 294pp; English.

Sample 6; Page 52; 294pp; English.

Calpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution corrain stages (e.g. dodecamer), have improved solution properties leading to enhanced productivity and greater therapeutic trility as stem cell protective agents. The analogues may be used utility as stem cells.

Cutility as stem cells.

proliferative stem cells.

proliferative stem cells.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-lalpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used un tumour therapy, psoriasis or other diseases involving hyperproliferative stem cells.

Protein with stem cell inhibition activity, e.g. LD78 or MIP-1
alpha - unable to form stable multimer higher than dodecamer,
T providing better tissue penetration
Example 5: Page 51; 294pp; English.
Analogues of natural stem cell inhibitors, such as LD78 and MIP-
C lalpha, having mutations to prevent or reduce multimer formation
beyond certain stages (e.g. dodecamer), have improved solution
c beyond certain stages (e.g. dodecamer), have improved solution
properties leading to enhanced productivity and greater therapeutic
in tumour therapy, psoriasis or other diseases involving hyper-
in tumour therapy, psoriasis or other diseases involving hyper-
C in tumour therapy, psoriasis or other diseases involving hyper-
C in tumour cells.
Most pref. LD78 analogues are Phel2>Gln, Ly844>Ser, Arg17>Glu (with
c analogues correspond to the pref. LD78 analogues.

                            Example 12; Page 54; 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-
hardous of natural stem cell inhibitors, such as LD78 and MIP-
lalpha, having mutations to prevent or reduce multimer formation
beyond certain stages (e.g. dodecamer), have improved solution
properties leading to enhanced productivity and greater therapeutic
utility as stem cell protective agents. The analogues may be used
proliferative stem cells.
                                                                                                                                                                                  Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg17>Glu (with Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha analogues correspond to the pref. LD78 analogues.

Canalogues of natural stem cell inhibitors, such as LD78 and MIP-

Ialpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution beyond certain stages (e.g. dodecamer), have improved solution to properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used in tumour therapy, psoriasis or other diseases involving hyper.

Considerative stem cells.

Most pref. LD78 analogues are Phel2>Gln, Lys44>Ser, Arg1>Glu (with Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha

Sample 18; page 56; 294pp; English.

Analogues of natural stem cell inhibitors, such as LD78 and MIP-1 alpha, having mutations to prevent or reduce multimer formation to properties leading to enhanced productivity and greater therapeutic properties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used to tumour therapy, psoriasis or other diseases involving hyperintumour therapy psoriasis or other diseases involving hyperic LD78 analogues are Phel2>Gln, Lys44>Ser, Argl7>Glu (with Gln18>Glu) and, esp., Asp26>Ala and Glu66>Ser. Pref. MIP-lalpha

CC Analogues of natural stem cell inhibitors, such as LD78 and MIPCC lalpha, having mutations to prevent or reduce multimer formation beyond certain stages (e.g. dodecamer), have improved solution componenties leading to enhanced productivity and greater therapeutic utility as stem cell protective agents. The analogues may be used number therapy, psoriasis or other diseases involving hypercompositive stem cells.

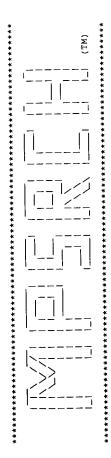

CC in the profit LD78 analogues are Phel2-GIn, Lys44>Ser, Arg17>GIn with analogues are Phel2-GIn, Lys44>Ser, Arg17>GIN with analogues correspond to the pref. LD78 analogues.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PTM: ONE MAJOR ISOFORM MCP-4, AND TWO MINOR ISOFORMS (LA)MCP-4 AND (FUNDGLA)MCP-4 ARE PRODUCED BY DIFFERENTIAL SIGNAL CLEAVAGE. (LA)MCP-4 IS ABOUT 30 FOLD LESS ACTIVE THAN MCP-4. SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE
                                                                                                                                                                                                                                                                                                                              POWER C.A. MEYER A., RISON S.C.G., GUYE-COULIN F., WELLS T.N.C.;
SUBMITTED (DEC-1997) TO EMBL/GENBANK/DDBJ DATA BANKS.
-!- FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES, LYMPHOCYTES,
--- BASOPHILS AND EGSINOPHILS. SIGNALS THROUGH
CCR2B AND CCR3 RECEPTORS. PLAYS A ROLE IN THE ACCHMULATION OF
LEUKOCYTES AT BOTH SIDES OF ALLERGIC AND NONLLERGIC INFLAMMATION.
MAY BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTERIAL
WALL DURING THE DISEASE PROCESS OF ARTHROCOLEROSIS. MAY PLAY A
ROLE IN THE MONOCYTE ATTRACTION IN TISSUES CHRONICALLY EXPOSED TO
EXOGENOUS PATHOGENS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MASS SPECTROMETRY: MW-9314; MW_ERR-30; METHOD-MALDI; RANGE-17-98.
MASS SPECTROMETRY: MW-8760; MW_ERR-30; METHOD-MALDI; RANGE=22-98.
MASS SPECTROMETRY: MW-8575; MW_ERR-30; METHOD-MALDI; RANGE=24-98.
INDUCTION: BY INTERLEUKIN-1 AND TNF-ALPHA.
INSUE SPECIFICITY: WIDELY EXPRESSED. FOUND. IN SMALL INTESTINE, THYMUS, COLON, LUNG, TRACHEA, STOMACH AND LYMPH NODE. LOW LEVELS SEEN IN THE PULMONARY ARTERY SMOOTH MUSCLE CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SIGNAL; GLYCOPROTEIN; INFLAMMATORY RESPONSE.

Characterization of novel chemokines using the Worldwideweb and expressed sequence tag databases.";

-1. LEUNC. BLOL. 61:550(1997).

-1. FUNCTION: CHEMOTACTIC FALTOR THAT ATTRACTS LYMPHOCYTES BUT NOT MONOCYTES OR GRANULOCYTES. MAY BE INVOLVED IN B CELL MIGRATION INTO B CELL FOLLICLES IN LYMPH NODES.

-1. TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN THE LUNG. A LOWER LEVEL EXPRESSION IS SEEN IN LYMPHOID TISSUES SUCH AS LYMPH NODES,

THYNUS AND APPENDIX.
                                                                                                                                                                                                                             -!- INDUCTION: BY LIPOPOLYSACCHARIDE (LPS).
-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SCHULZ KNAPPE P., MAEGERT H.-J., DEWALD B., MEYER M., CETIN Y., KUBBIES M., TOMECZKOWSKI J., KIRCHHOFF K., RAIDA M., ADERMANN K., KIST A., REINEKER M., SILLARD R., PARDIGOL A., UGUCCIONI M., BAGGIOLINI M., PORSSMANN W.-G., "HCC-1, a novel chemokine from human plasma.";

SUBMITTED (OCT-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

C. PUNCTION: HAS WEAK ACTIVITIES ON HUMAN MONOCYTES AND ACTS VIA

RECEPTORS THAT ALSO RECOGNIZE MID-1 ALPHA. IT INDUCED

INTRACELLULAR CA2+ CHANGES AND ENZYME RELEASE, BUT NO CHEMOTAXIS,

AT CONDENTRATIONS OF 100-1,000 NM, AND WAS INACTIVE ON T

LYMPHOCYTES, NEUTROPHILS, AND ENSINOPHIL LEUKOCYTES. ENHANCES THE

PROLIFERATION OF CD34 MYELOID PROGENITOR CELLS.

C. 1- TISSUE SPECIFICITY: EXPRESSED CONSTITUTIVELY IN SEVERAL NORMAL

TISSUES: SPLEEN, LIVER, SKELETAL AND HEART MUSCLE, GUT, AND BONE

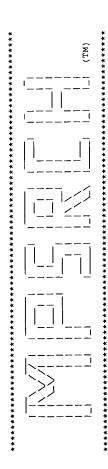

TISSUES: SPLEEN, LIVER, SKELETAL AND HEART MUSCLE, GUT, AND BONE

C. SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE

C.-C) (CHEMOKINE CC).

Database:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
